How to Research

keywords, library databases, citation importing

Joy Kim
BCC Librarian

Today’s Goals…

1. Understand what keywords are and how to create them.
2. Review “popular” and “scholarly/peer-reviewed” sources.
3. Know how to use two databases at the end of this lesson.
4. Learn how to import citations via email from databases.

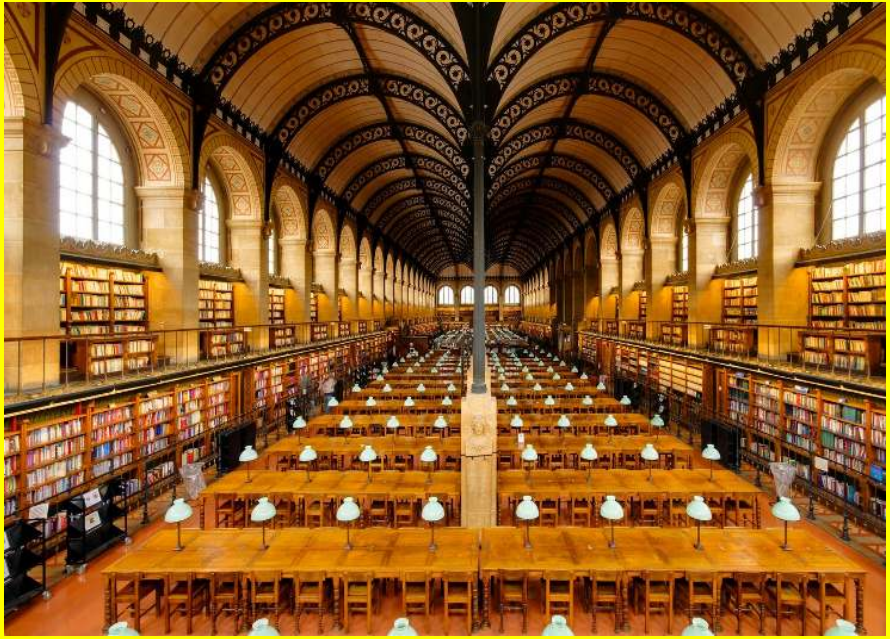
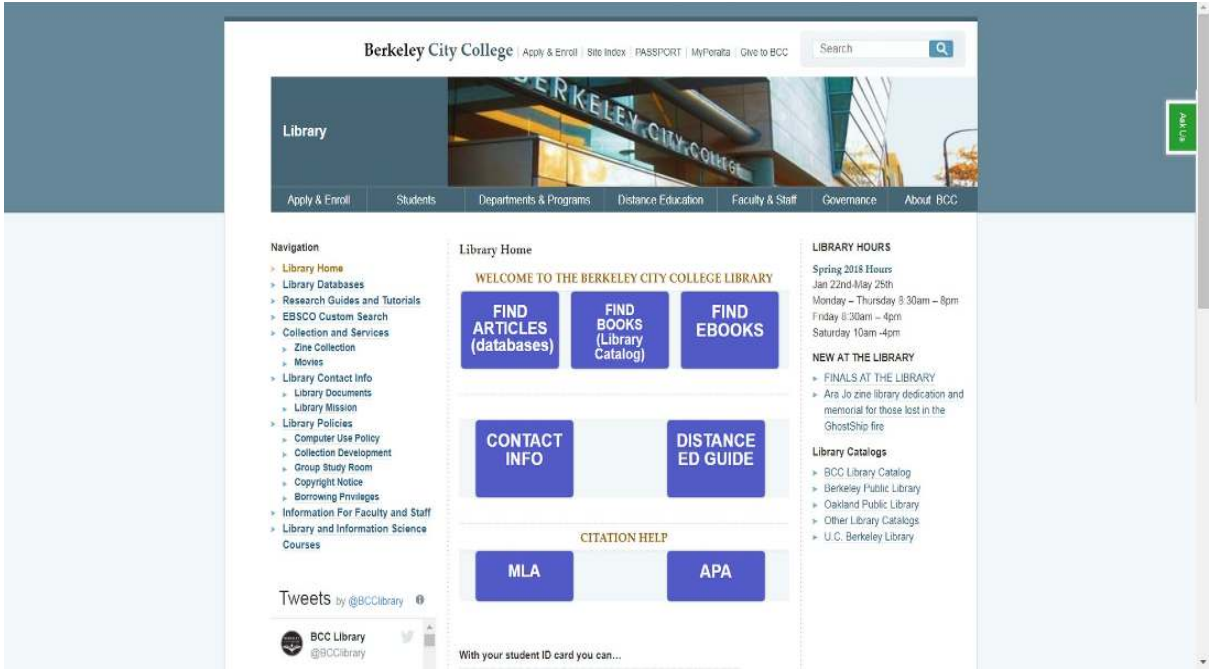
BURGER KING



Berkeley Library Website

Question 1:
What is the difference between a **Catalog** and **Database?**

Question 2:
How do I know which database to use?



What are keywords?

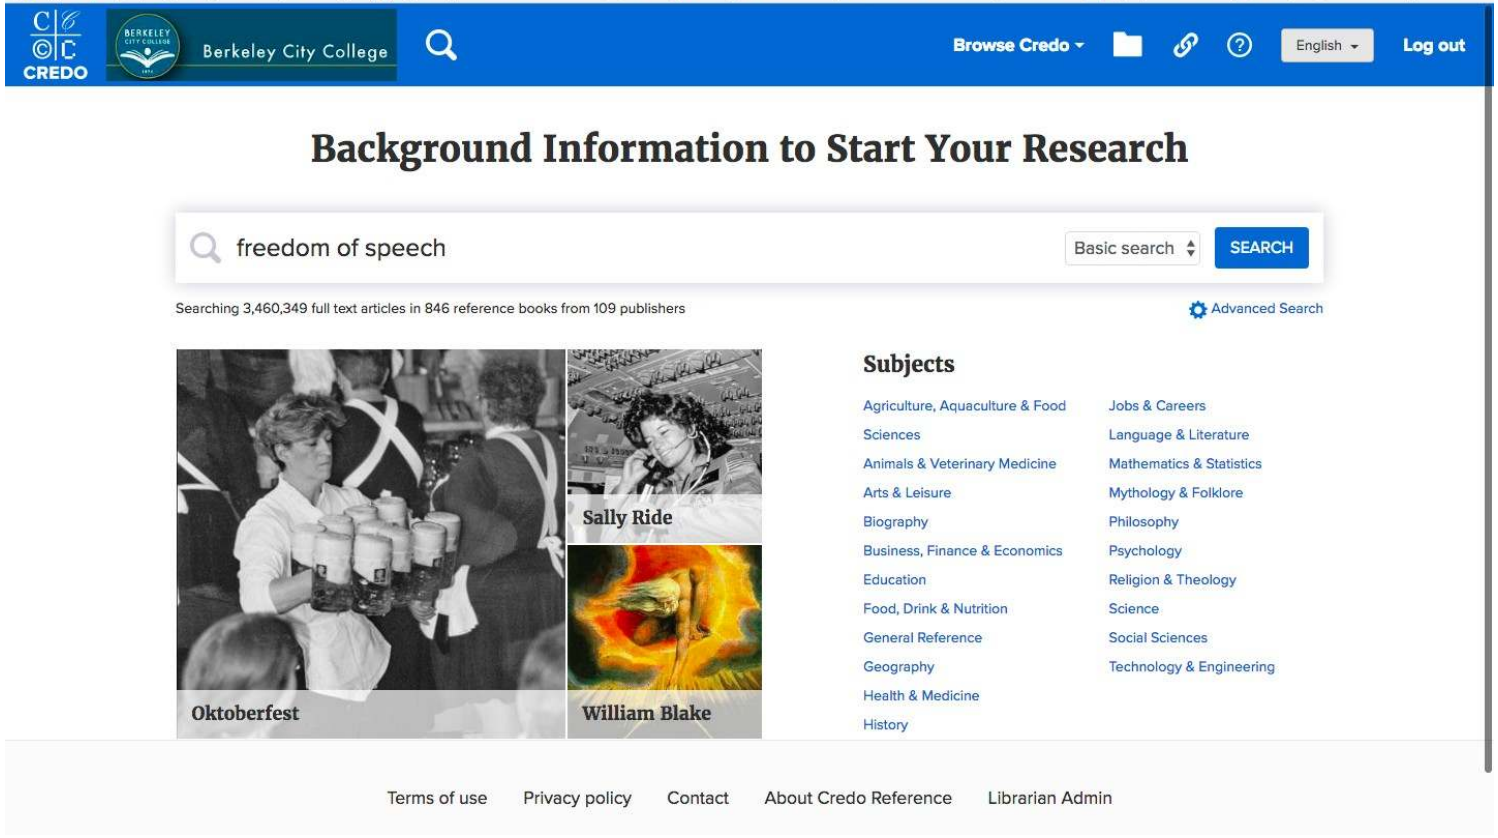
Keywords are short.

Keywords are nouns and main ideas.

Keywords are synonyms.

Keywords can change.

Credo Reference (Encyclopedia)



Broad--->Narrow--->Related

Example topic: Alcohol abuse

Broad

Narrow(name, gender, time period, subtype, location, title..)

Related

Domain Suffixes you should know...

.com = Commercial site. The information provided by commercial interests is generally going to shed a positive light on the product it promotes. While this information might not necessarily be false, you might be getting only part of the picture. Remember, there's a monetary incentive behind every commercial site in providing you with information, whether it is for good public relations or to sell you a product outright. (See the Information, Disinformation, Misinformation page)

.edu = Educational institution. Sites using this domain name are schools ranging from kindergarten to higher education. If you take a look at your school's URL you'll notice that it ends with the domain .edu. Information from sites within this domain must be examined very carefully. If it is from a department or research center at an educational institution, it can generally be taken as credible. However, students' personal Web sites are not usually monitored by the school even though they are on the school's server and use the .edu domain.

.gov = Government. If you come across a site with this domain, then you're viewing a federal government site. All branches of the United States federal government use this domain. Information such as Census statistics, Congressional hearings, and Supreme Court rulings would be included in sites with this domain. The information is considered to be from a credible source.

.org = Traditionally a non-profit organization. Organizations such as the American Red Cross or PBS (Public Broadcasting System) use this domain suffix. Generally, the information in these types of sites is credible and unbiased, but there are examples of organizations that strongly advocate specific points of view over others, such as the National Right to Life Committee and Planned Parenthood. You want to give this domain scrutiny. Some commercial interests might be the ultimate sponsors of a site with this suffix. (See the Information, Disinformation, Misinformation page)

.mil = Military. This domain suffix is used by the various branches of the Armed Forces of the United States.

.net = Network. You might find any kind of site under this domain suffix. It acts as a catch-all for sites that don't fit into any of the preceding domain suffixes. Information from these sites should be given careful scrutiny.
